Legend

F = page fault
B = process blocked
R = process ready
Pa(Xb) = processed page b of process a (X = R read, W write)

Clock - Fixed-Local Replacement, 30 frames (7 per process, 2 not allocated), quantum 3, input: Process1.txt ... Process4.txt

WB = dirty page(s) written back to the disk (1 time unit): a dirty victim page (paid by the faulting process) or, after the last execution of a process, all its dirty pages in paralle
Orange blocked-indicator cell = the write-back time unit (the process finishes at the end of the orange cell if it is the last write-back)
